DIRECTOR

October 8, 1968

Honorable Spiro T. Agnew  
Governor of Maryland  
The State House  
Annapolis, Maryland

Dear Governor Agnew:

I am pleased to transmit the enclosed report entitled The Labor Force of Maryland: Projections of Socio-Economic Characteristics to 1980. This report is another in the series being developed for the State-Wide Planning Program administered by this department. While a substantial portion of the work embodied in this report was carried out during the tenure of my predecessor, Mr. James J. O'Donnell, I am most pleased to have been associated with the project in its final phase.

This study provides an analysis of the characteristics of the labor force of Maryland's subregions as projected to 1980. It represents an initial attempt to assess future patterns of human resource allocation in order to provide guidelines for issues which relate to the typical range of planning and manpower development problems.

We feel certain that this study will be helpful to many individuals, agencies and departments who are interested in obtaining greater insights into the specifics of the structure and growth of Maryland's labor force. Copies of this study are being distributed throughout the State.

Sincerely yours,

*Vladimir Wahbe*  
Vladimir A. Wahbe  
Director

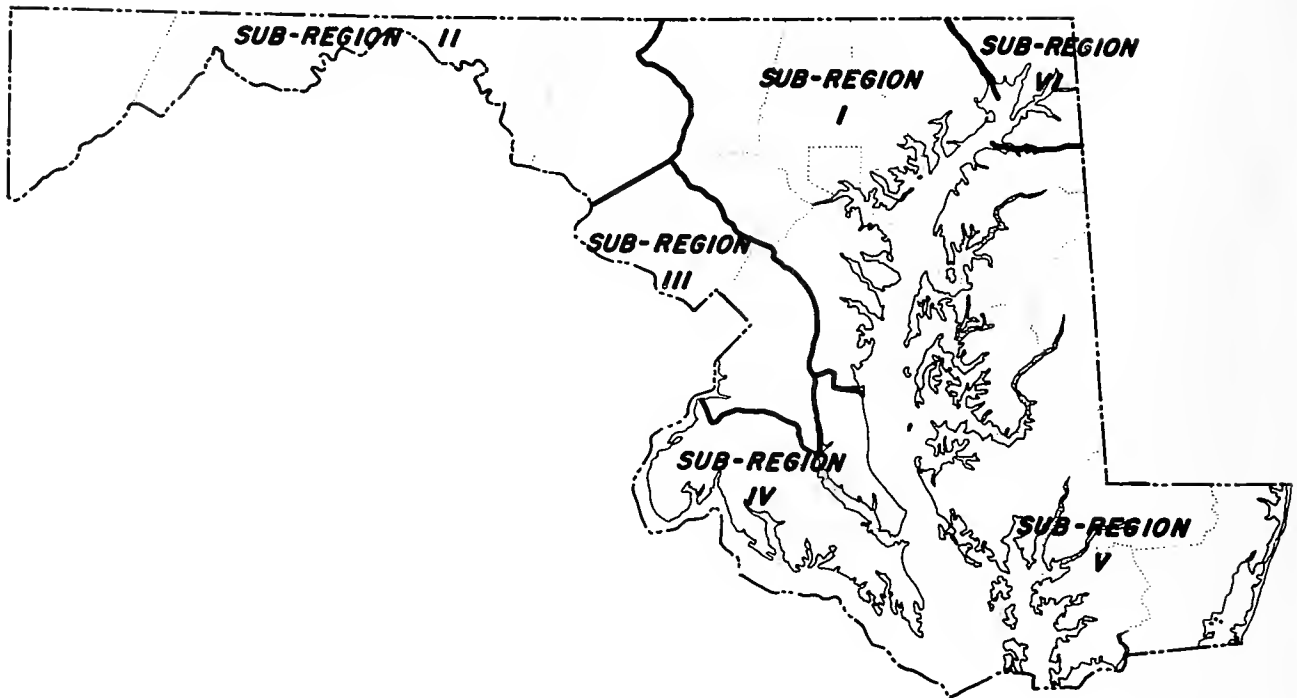

## Preface

The projections of labor force characteristics presented in this report represent an initial attempt to examine the future pattern of human resource allocation within the State. As such, the study provides both an analytical set of conclusions and a large body of data upon which additional insights may be based or existing ones tested. Most importantly, the study provides a vehicle which enables more specific types of investigations to be carried out in areas relating to manpower training programs, higher education, and other types of social legislation. It is also expected that the information presented can provide the relevant inputs for evaluative studies of public programs relating to the typical range of planning problems encountered in State government.

Persons who at various times contributed to this study include Gary A. Lee, Bertha Butler, and Sondra Oglesby. Special praise is due Regina Seltzer for her assistance throughout the preparation of this study.

## INTRODUCTION

This study represents an initial attempt to assess future patterns of human resource allocation within specific areas of the State. A detailed analysis of the structure of the labor force is presented, and projections are made to 1980 of age, sex, major occupation group, industry, and level of educational attainment.

Apart from the need to develop a thorough understanding of the State's present and future human resources in evaluating overall resources for economic growth in the State, the development of detailed projections of the socio-economic characteristics of the labor force contributes to the evaluation of facilities needs in areas of concern such as education, recreation, and housing. In addition, the data should facilitate the development of insights into a range of other infrastructural requirements which are not functionally related to population size alone.

It should be pointed out that this study is not the typical type of manpower analysis useful for vocational guidance and allied purposes. Major occupational groups rather than detailed occupations are delineated and therefore the projections are not suitable for estimating curricula needs or future job openings for detailed occupational classifications. However, a great deal of information is developed which should be useful to the analyst concerned with generalized types of decisions and interest in the socio-economic characteristics of the labor force in different areas of the State.

State and regional educational planning to meet manpower needs may benefit from the generalized occupational projections provided in the study in terms of creating broad-based vocational programs in order to insure maximum flexibility of both choice and applicability. In addition,

changing concepts and resultant criteria relevant to educational planning may make the use of generalized occupational projections more pertinent in the near future. The study results provide a framework for future detailed surveys which would be designed to investigate the need for investment in new educational facilities and programs, or to analyze the adequacy of present programs and facilities. Importantly, then, the study serves as an initial instrument to develop a basis for State policy planning in the human resources area. It is hoped that the study will stimulate further integrated efforts within the State towards comprehensive social and economic planning for the effective utilization of human resources on a statewide basis. Accordingly, this study provides much detailed data which should enable both the analyst and the informed reader to proceed independently to form additional conclusions or use as a base for further investigation.

The description of the socio-economic characteristics of the labor force in this study centers around the development of a detailed set of matrices of the occupational profiles of individual economic sectors of the State's economy. This enables the analyst to identify the particular type of major occupational groups associated with the growth of these sectors. The matrices are assumed to be reflective of a set of interacting forces which include the effects of technological change, labor supply, and labor demand. The labor force analysis consists of three separate components: 1) a projection of the future demand for all persons in the labor force by occupation and by industry; 2) a projection of the labor force by age, sex, and level of educational attainment; and 3) a comparison of the projected demand for and supply of labor in terms of educational attainment, yielding a profile of the future employment of major occupational groups with a given level of educational attainment.

The future availability of labor force skills appropriate to satisfy the implications of technological change is becoming more closely related to the formal educational system. With the relative decline in "commodities or goods producing" sectors of the economy and the growing emphasis upon "noncommodities," the share of technically oriented occupations in which higher analytical capacity is required is increasing rapidly. Therefore, the use of educational attainment to measure the capacity of the labor force to adapt to changing job requirements is considered reasonable in that many occupational classifications can be linked directly to the achievement of a given number of years of school completed.

The detailing of all projections in the study by sex should provide the analyst with more information than can usually be obtained to permit an assessment of changing labor force composition by occupation. This is particularly important in the light of increasing rates of female labor force participation in many labor market areas.

It is important to note that because of the complex nature of labor market adjustments to changing economic conditions and the inability to trace these adjustments in detail, the projections of occupational characteristics are subject to more than the usual degree of uncertainty that normally is attributable to economic projections. In addition, the subregions which have been used in this study do not in all instances represent realistic labor market areas. It was not possible to provide alternative groupings of counties for study purposes because of the lack of input data for areas outside of the State and decisions made in other related studies as to the functional geographic areas which would be used. Therefore, for some of the subregions delineated, as shown in Chart I, significant journey to work patterns invalidate the usual in-subregional association between place of work and place of residence. This is

particularly true for subregions III and VI where a large proportion of the labor force work outside the subregion of residence. Given this limitation, the projections for these subregions are included only to provide the analyst with a base for further study and to enable the testing of the usefulness of this approach for small geographical areas.

The analyst should be cautioned about the efficacy of using the projections in this study without much accompanying reasoning or knowledge of the particular labor market conditions in the subregion he is concerned with. These projections serve only as rough indicators of trends based upon a given set of assumptions for each subregion. Therefore, the present study should be considered as an explorative first attempt at human resource analysis for the State and the reader's attention should be carefully directed to the following chapter on methodology. An overview of the study results is then presented to serve as a guide to the use of the tables rather than as a description of the projections presented.

## METHODOLOGICAL FRAMEWORK

Demand Analysis

The development of a matrix of occupation by industry of employment was facilitated by the use of data inputs obtained from other related studies undertaken by the State Planning Department. One such study provided projections of employment by three-digit industrial codes which were aggregated into thirty-one industry sectors for use in the occupation by industry matrix. In this study, the interrelationship between national, regional and subregional levels of employment for each economic sector were examined through the use of a model based upon a version of the export base approach. State and subregional employment by industry was projected using national and regional control totals and differential shift analysis to evaluate competitive potential among subregions of the State and to indicate their share of slow or fast growing national industries.<sup>1</sup> A distribution of employment by sex for each of the three-digit industry groups was developed using census of population data. A program was utilized to examine male employment as a proportion of the total for each subregion using 1960 Census data. Because census of population data measures employment by place of residence only, the resultant distribution was evaluated by a comparison with existing state directories of manufacturing establishments which show the proportion of male and female employment by place of work.<sup>2</sup> For other industry groups, zero rates of inter-subregional journey to work trips were assumed. While this is not altogether satisfactory, the unadjusted data

---

<sup>1</sup> For a detailed description of the model, the reader is referred to a companion study entitled The Economy of Maryland: Projections to 1980, Maryland State Planning Department, October, 1968.

<sup>2</sup> 1960 Census of Population, PC(1) 22C, General Social and Economic Characteristics, and Directory of Maryland Manufactures, Maryland Department of Economic Development, 1962-1965, 1965-1967.

is only significant for Subregion III where a large proportion of jobs are held outside of subregional boundaries.

The existing sex distribution of jobs for each industry group was moved forward to 1980 on the basis of projected labor force participation rates for females and historical trends in the mix of male and female jobs in dominant industry groups in each subregion. An overall rate of increase in female job participation was used together with selective changes for industry groups which had historically shown a tendency towards increased female job participation. These industry groups are typically the fastest growing industries in the respective subregions and in some instances, the rate of increase in the proportion of female jobs averaged between 3 and 4 per cent for each decade. This procedure was carried out for each subregion, taking careful account of those subregions which have experienced high female labor force participation rates or relatively high proportions of females in the middle age groups. This projected proportion of employment by sex for each industry group was then multiplied by an occupation industry matrix for the identical industry groups in order to obtain totals in each occupation by industry group for the years 1960, 1970, and 1980. The 1960 occupation-industry matrix was developed for each subregion by aggregating county data supplied by a special unpublished census of population tabulation of 1960 occupation by industry detail for each sex. The 1960 census matrix was moved forward to 1970 and 1980 by identifying trends in the occupational composition of industry groups through the use of national distributions developed for 1960 and 1975 by the Office of Manpower and Employment Statistics of the Bureau of Labor Statistics in addition to an examination of relevant historical materials for the State.<sup>1</sup> Where it was evident that

---

<sup>1</sup> Tomorrow's Manpower Needs, National Manpower Projections and a Guide to Their Use as a Tool in Developing State and Area Manpower Projections, Draft Copy, 1967.

the national pattern of occupational composition for any given industry was not appropriate, or if knowledge of any specific circumstance as to technological advancement and factor organization was introduced, changes were made accordingly in the Maryland ratios. In most instances, it was determined that the patterns of occupational composition in large national industry groups were essentially similar to their counterpart in Maryland.

The national industry-occupational matrix developed for 1960 and 1975 by the Bureau of Labor Statistics was based upon an approach which related projected levels of employment in specific sectors to estimates of occupational structure. In addition, employment in selected occupations was also projected independently, particularly where it was possible to relate employment to a limited number of variables. The national projection of the occupational structure of each industry was based on an examination of historical statistics from multiple sources and an evaluation of other factors that might influence occupational structure, such as expected new technology, changes in the product mix and general factor organization of industries. Emphasis was placed upon efforts to uncover emerging factors that might be significant in the future as well as a careful delineation of past trends to determine the occupational ratios that should persist in the future. These national ratios reflect a projected skill pattern that is assumed to be required by each industry independently of the availability of specified required skills. The adjustment by both industries and individuals to manpower shortages is assumed to have been worked out in terms of unidentified labor market adjustments. The occupational ratios were developed in relation to particular levels of employment in each industry and are therefore relatable to given levels of industry output.

### Supply Analysis

The analysis of supply made use of a projected population distribution by age and sex developed as a component part of an economic-demographic model of the individual subregions within the State. The procedures used in preparing the population projections involved a study of the prospects for each subregion's economy and the extent to which the demand for labor or future labor force requirements could be met by the subregion's resident population. Shortages or surpluses, as the case may be, induce migration of males of labor force age, i.e., immigration in the event of a shortage, outmigration in the event of a surplus or oversupply of labor. Net migration balances, therefore, were essentially based upon this comparison between the number of males in a closed labor-force population and the number of males in the labor-force population required by projected employment within the subregion. Final migration balances were based upon iterations and adjustments of both the labor force participation rates and the unemployment rate in order to provide the necessary refinements which would be typical for any given labor market adjustment to any level of employment change.<sup>1</sup>

The projected educational attainment for the population of labor-force age was developed on the basis of data obtained from the Census of Population for Maryland in 1950 and 1960. Educational attainment achieved by specific age-sex groups in the population was projected upon the basis of past trends in Maryland and projected distribution of nationwide levels of educational attainment for specific age-sex groups.<sup>2</sup> The projection of educational attainment by specific age-sex groups is necessary because of

---

<sup>1</sup> For additional details, the reader is referred to The Population of Maryland: Projections to 1980, Maryland State Planning Department, July 1967.

<sup>2</sup> 1960 Census of Population, PC(1) 22D, Detailed Characteristics, Tables 101, 102, 103 and Current Population Reports, Series P-25. No. 305, April 1965. "Projections of Educational Attainment in the United States: 1965 to 1985."

the need to examine only the educational attainment of those persons who are still in, or will be in, the labor force throughout the projection period. For the projection period, state-national relatives were developed for each age-sex group and further specified to allow for labor-force participation of persons typically completing a given level of educational attainment. These ratios were applied to the projected population in each age-sex group in order to yield a profile of all persons in the labor force by age and sex which explicitly takes into account the differentials in present and expected educational attainment of any given specific age-cohort group. In general, the projections developed for each age-sex group assumed that social attitudes would encourage increased participation by young adults in both high school and post-high school educational programs and constant participation by persons beyond the age of 34. Labor-force participation rates generally tend to be higher for persons with more education. The only exceptions are for males in the central working ages (25-54 years old), who traditionally have high labor-force participation rates regardless of level of school completed. The participation rate for women with high levels of educational attainment is relatively high regardless of age, color or marital status. It is expected that as more complicated and more specialized jobs appear in the economy, this pattern will be reinforced as the demand will grow for highly trained and educated women.

#### Comparison of Supply and Demand

The occupation-industry matrix for each subregion was summed across in order to obtain totals for each major occupation group. An estimate of the number of years of school completed usually associated with each major occupation group was developed and moved forward to 1970 and 1980 primarily

on the basis of trends for the period 1952 to 1965.<sup>1</sup> The matrix of the proportion of each occupation group having obtained a given number of years of school completed was multiplied by the total in each occupation group in order to yield a description of all persons in the labor force by occupation having obtained a specified level of educational attainment. This demand for persons by level of educational attainment can then be related to the projected number of persons in the labor force who are expected to achieve given levels of educational attainment in order to evaluate the allocation of labor skills over the projection period by indicating shortages or surpluses in each occupational classification.

The summation of the occupation-industry matrix and its comparison with the expected number of persons who will obtain specified levels of educational attainment, implies the use of a situational type of approach. The methodological procedures attempt to simulate an adjustment in which variables such as population, labor participation and skill capacity on the supply side, and employment levels, technological organization, and skill requirements on the demand side are strategic in determining a final outcome. The generalized categories of labor participation and skill capacity represent a basic flow of persons with given skills (levels of educational attainment) who are entering and leaving the labor force over a time span. Importantly, therefore, it should be noted that the occupational profile at any given time represents an interaction of supply and demand factors which may not be representative of the actual or traditional industry skill requirements. This is because industry substitution of skills or different degrees of skill utilization arise because of shortages or surpluses of skills and the use of technological innovations. The application, therefore,

---

<sup>1</sup> See Special Labor Force Study No. 65 Educational Attainment of Workers in 1965 for a discussion of trends and the U. S. Census of Population PC(2), 7B Occupation by Earnings and Education for 1960 Data for the United States.

of a projected skill requirements matrix to changing supply conditions may not fully take into account accompanying industrial adaptation. Consequently, the projections are only indicative of general trends in the levels of skill (occupational) utilization. However, short-term rigidities in the industry utilization mix may provide some consistency in the indicated trends for a reasonable period of time because of the possibility of corrective adjustments through migration and the inability of industry to absorb technological innovations over the short-run and consequently change the composition of its labor input.

The linking of a particular level of educational attainment with a given occupational classification is not altogether satisfactory. Census occupational classifications by industry may well represent sociological values rather than job requirements and it is questionable whether the employment of a specific occupational group necessarily implies a specific educational requirement. Immediately, it is evident that a larger cross-sectional data base is needed to properly analyze the interrelationship between the level of educational attainment required by specific industry-occupational situations and that which exists because of the interaction of supply and demand factors. The use, therefore, of a projected requirements matrix based upon historical data for the analysis of particular situations must be tempered by a careful evaluation of all pertinent supply and demand conditions which lead to the particular industry-occupational structure.

It can be noted that the use of educational attainment has its antecedents in a pioneering study by the Battelle Memorial Institute for the State of Michigan.<sup>1</sup> The Michigan labor-force analysis involved a comparison of the supply and demand for labor using educational attainment as the

---

<sup>1</sup> The Michigan Manpower Study: An Analysis of the Characteristics of Michigan's Labor Force in the Next 15 Years. November, 1966.

equating variable. The Michigan study developed detailed matrices of the occupational profiles in industry sectors and utilized special cross-sectional census tabulations. The role of the manpower requirements approach has also been evaluated by the Organization for Economic Cooperation and Development in a similar type of study design.<sup>1</sup>

For purposes of generalized analysis, the linking of a given level of educational attainment with a given occupational classification appears reasonable in that many occupational classifications are characterized by minimum levels of educational requirements and others by maximum levels. Our generalized analysis places its emphasis upon the capacity of Maryland's labor force to adapt to changing industry requirements. The rapid growth of professional and other white-collar occupations during the post-war period indicates that the labor force in the 1970's will require an increasing use of conceptual and technical rather than manual skills. The examination of the expected skill level of the Maryland labor force in relation to future industry requirements is therefore considered appropriate.

## AN OVERVIEW OF THE PROJECTIONS

### Demand Characteristics

The tables presented in Section A provide a view of projected employment by major occupation groups for each subregion of the State and an occupation by industry matrix for 1960, 1970, and 1980 for males and females. A projected distribution of male and female employment in each industry group is provided in the appendix of this report.

The matrices included in this section represent the demand by each industry group for persons in each occupational classification that will be required by the technology existing in each industry in 1960, 1970, and 1980. The usefulness of the matrix form of presentation is revealed when it is seen that significant growth trends in occupational employment exist which could not have been determined by an overall projection of employment for a particular occupation or industry group. In the managerial and proprietary occupations for example, male employment in the State showed a net increase of 8,265. However, the distribution of this increase in Construction, Wholesale and Retail Trade, Finance, and Public Administration was 6,137 above the net increase of 8,265 for all industries. Therefore, an assessment of future employment in major occupations within each industry is essential to any appraisal of future skill needs.

### Supply Characteristics

The tables in Section B provide a picture of the projected labor force classified by age and sex. They have been derived by the application of labor-force participation rates to the civilian population in each age group and further specified by level of educational attainment. The labor-force participation rates were adjusted to reflect expected increases in school enrollment as well as increased labor-force participation of the

relevant segments of each subregion's population. Accordingly, these projections reveal: 1) a stability in the labor force participation rates for males aged 25-64, 2) a decreasing labor-force participation rate for all persons between the ages of 15 and 25, and 3) an increasing rate for females, particularly those between the ages of 35 and 64. While it can be noted that expected behavior of these rates are very much in line with those that have been projected for the nation, there are differences in overall participation rates among subregions in Maryland. Accordingly, the study has utilized subregional-specific participation rates rather than the national average. The variances in rates among subregions in Maryland are attributable primarily to age-sex mix and job-opportunity differences which can be readily identified for each subregion.

It is reasonable to assume that the average quality of the labor force as a whole is affected by its composition in terms of its age and sex components. Accordingly, one reason for the upgrading in the educational attainment of the labor force is that the supply of better educated workers is increasing as young workers with more schooling enter the labor force and replace older workers. In addition, the demand for better educated workers increases as jobs become more specialized and technical in nature and because employers tend to utilize the increasing supply of better educated workers in more varieties of job classifications and consequently demand more of their services.

A careful examination of the projections of labor force by age and sex reveals that despite a decreasing labor-force participation rate for persons between the ages of 15 and 25, the proportion of these persons in the total labor force is expected to grow. This is attributable primarily to the high birth rates of the 1950's. It can be noted that the decreasing labor-force participation rate for this age group is a result of both the

decline in the relative importance of the agricultural sector and higher levels of school enrollment, apart from the possibility of a lack of job opportunities.

While it is discernable that an increasing number of persons in this age group are completing or will complete more years of schooling than before, we do not know if this new level of educational attainment for this particular age group will accommodate quantitatively to existing industry demand for a given level of capability. Therefore, while the supply analysis does not directly lead to conclusions as to the capacity of all persons in this age group to become absorbed, it permits this kind of a question to be raised.

For the total labor force, however, our projections of all persons by occupation with specific levels of educational attainment are more revealing of trends in resource utilization. In Section C, the demand for persons by level of educational attainment is compared to the number of persons in the labor force who have achieved, or are expected to achieve, given levels of educational attainment (supply result).

The supply result represents a basic flow of persons capable of being absorbed in some way into the mainstream of economic activity. The aggregate response to industry demands (requirements) is conditioned essentially by the characteristics of this flow. However, it should be noted that the flow includes a number of persons migrating to the State in direct response to industry demand. The supply result, accordingly is continually conditioned to the needs of industry in the State through immigration of necessary skills given their availability. This does not imply that immigration is a balancing mechanism which can equate the supply and demand for labor in a particular subregion. It implies that migration only contributes along with labor participation changes which are directly

influenced by the subregion's age-sex mix and its comparative size. In addition, the labor market operates to provide substitutions in the labor force when the ideal demand situation cannot be obtained. Accordingly, the supply-demand results in Section C may not adequately reflect industry substitutions for any given type of skill shortage.

#### Comparison of Supply and Demand

The supply-demand result represents the process of interaction between supply and demand for individual occupations at each level of educational attainment. For each Maryland subregion, therefore, the supply-demand result can be meaningfully described in terms of expected shortages of individual occupations with a given level of educational attainment. Depending upon the level of educational attainment indicated, these shortages are indicative of the need for additional educational facilities or of heavy industry demand situations of either a short or long-run nature. Therefore, if the supply result at any given level of educational attainment cannot over a reasonable period of time match the demand for occupational skills as reflected in the supply-demand result, then public action may be indicated. It should be noted that public action does not necessarily have to take the form of increased educational facilities, but may relate to the addition of area infrastructural or amenity type of facilities with the view towards the attraction of needed occupational skills into specific areas of the State and the retention of existing skills which are in short supply.

The particular mix of public investment policies designed to alleviate specific skill shortages will, of course, depend upon the specific skill shortage. Shortages of female clerical workers with a high school education, for example, are usually related to a subregion's age-sex mix and most directly to the female labor participation rate. Because high female labor participation rates are place specific, public investment

policies are not usually applicable, and consequently industry demand for female workers may be of a short-run duration or non-existent in a particular area. Shortages of male professional workers, on the other hand, imply a mix of public investment policies that include both additions to existing training institutions and to an area's amenities.

A careful review of the projections of supply-demand results for each subregion generally reveals a shortage of most occupations at the one to three years of college level of educational attainment. In all instances, there is an evident shortage of both males and females who have completed a high school education. Shortages, particularly at the professional, technical, and managerial levels are projected to exist more so for females than for males at the four or more years of college level in many subregions of the State. Again, for females, more so than males, the projected shortages appear at the one to three years of college level of educational attainment.

## Industry Classifications

Agriculture, Forestry and Fishing - farming, agricultural services, forestry, fisheries

Mining - metal, anthracite and bituminous coal, petroleum, stone quarrying

Construction - building, and miscellaneous construction, heavy

Food and Kindred Products

Textile Mill Products

Apparel and Other Fabricated Textile Products

Furniture, Lumber and Wood Products

Printing and Publishing

Chemicals and Allied Products

Rubber and Miscellaneous Plastics

Primary Metals

Fabricated Metals

Machinery, except Electrical

Electrical Machinery

Motor Vehicles and Equipment

Aircraft and Parts

Other Transportation Equipment

Other Durable - Ordnance and accessories; stone, clay and glass products; professional, scientific and controlling instruments; miscellaneous manufacturing

Other Non-Durable - Tobacco manufacturing, pulp and paper products, petroleum products, leather products

Railroads, Railway Express Services, Warehousing and Other Transportation Services

Communications

Public Utilities and Sanitary Services

Wholesale Trade

Retail Trade

Finance, Insurance and Real Estate - banking, credit agencies other than banks, insurance carriers, insurance agents and brokers, real estate, holding and investment companies

Business and Repair Services - miscellaneous business services; auto repair, services and garages; miscellaneous repair services

Entertainment and Recreation Services

Personal Services including Private Households - hotels, motels and rooming houses, personal services and private household services

Medical, Educational, Welfare and Other Professional Services - medical and health services, legal services educational services, miscellaneous organizations, miscellaneous services

Public Administration - postal service and federal government, state government, local government, international government
